the first book to cover the entire spectrum of spatial disorientation in flight this book examines the long history of spatial disorientation in flight describes the movements of aircraft in mathematical detail and explains how these movements can conspire to fool human sensory systems it also examines the visual mechanisms that contribute to perceptions of self motion describes the contribution of psychological factors to spatial disorientation and defines the types of visual and nonvisual illusions pilots experience in flight

this is the tenth edition 1954 of k d wood s airplane design despite its age it is the favorite of amateur aircraft designers because it sits on the cusp between propeller driven low subsonic airplanes and the huge increase in military performance represented by supersonic and hypersonic aircraft and in commercial value represented by high subsonic jet propelled airliners it is also situated inside the early heroic period of helicopter development and wood s knowledge of that then exotic aircraft comes out clearly he still includes wood as an aircraft material and geodetic structures and tube trusses as structural arrangements without neglecting the monocoque and semi monocoque metal structures that were then becoming more common he also covers seaplanes and flying boats a topic essentially ignored today he recognizes the potential of fiber reinforced plastics and discusses them to the extent possible at the time this is the companion volume to k d wood s technical aerodynamics third edition this improved facsimile reprint has a new detailed table of contents accurate pagination and improvements to some of the illustrations
