biometrics based authentication and identification are emerging as the most reliable method to authenticate and identify individuals biometrics requires that the person to be identified be physically present at the point of identification and relies on something which you are or you do to provide better security increased efficiency and improved accuracy automated biometrics deals with physiological or behavioral characteristics such as fingerprints signature palmprint iris hand voice and face that can be used to authenticate a person s identity or establish an identity from a database with rapid progress in electronic and internet commerce there is also a growing need to authenticate the identity of a person for secure transaction processing designing an automated biometrics system to handle large population identification accuracy

and reliability of authentication are challenging tasks currently there are over ten different biometrics systems that are either widely used or under development some automated biometrics such as fingerprint identification and speaker verification have received considerable attention over the past 25 years and some issues like face recognition and iris based authentication have been studied extensively resulting in successful development of biometrics systems in commercial applications however very few books are exclusively devoted to such issues of automated biometrics automated biometrics technologies and systems systematically introduces the technologies and systems and explores how to design the corresponding systems with in depth discussion the issues addressed in this book are highly relevant to many fundamental concerns of both researchers and practitioners of automated biometrics in computer and system security

research on biomechanics sensing and bio inspired control is vital for progressing rehabilitation and wearable robotics biomechanical simulation can provide the theoretical basis for device design and optimize the design and control scheme the fusion of bio signals neural signals and physical signals is helpful for accurate perception and recognition of human motion intention bio inspired control is an important direction of individualized and efficient assistance of rehabilitation and wearable robotics in recent years with the development of biomedical and information technology the equipment used for information acquisition has been updated from cumbersome and immobile devices to small and portable ones making integration with rehabilitation and wearable robotics easier moreover the performance of rehabilitation and wearable robotics can be quantified by changes in biomechanics and through the use of biosensors the proposed research topic invites theoretical and experimental research dealing with novel techniques for quantifying biomechanics sensing and bio inspired control in rehabilitation and wearable robotics for example the use of biologically inspired actuators no longer requires rigid supports as the skeletal system can be used to that end the application of synergies or motor primitives has led to a reduction in the number of actuators or to improve their control the latest advances in modeling and simulation made it possible to assess and control fatigue or simulate using such devices outside of a clinical environment these research achievements enable a new generation of rehabilitation and wearable robotics
